The bundle only makes sense when it is sold as one capital system. BTC is the compounding core. XRP is the asymmetry sleeve. The proof question is whether each engine solves its own job well enough that combining them under written rules becomes economically cleaner than improvisation.

1. Why the bundle exists

Question	Answer
Why own BTC?	Because a reserve-core engine should be benchmarked against blind weekly buying and judged by whether it compounds more BTC-equivalent value under a usable workflow.
Why own XRP?	Because asymmetry should be governed by a real cycle framework, staged defense, and live accountability rather than by blind hold-through-cycle behavior.
Why own both?	Because the real economic job may be turning asymmetry into reserve quality without letting the amplifier take over the portfolio.

2. What each engine contributes

- BTC contributes benchmarked reserve-core compounding, hardened decision-basis integrity, and visible accountability versus blind auto-buy.
- XRP contributes cycle-state recognition, matched-window benchmark superiority, robustness checks, clearly separated Safety behavior, and live Weekly Plan scorekeeping.
- The bundle contributes written sleeve caps, reserve handling, transfer windows, and simplify rules that stop mid-cycle capital mistakes.

3. When the bundle is the right buy

Buy both when BTC is already meant to be the destination asset and XRP is meant to be a capped amplifier. Do not buy both if the result will be emotional capital rotation or a second identity battle between the sleeves.

The bundle's core promise is simple: use XRP to create selective asymmetry and use BTC to keep the portfolio anchored.

The fairest short description is this: the bundle is a better capital architecture, not a bigger pile of tools.
