The bundle is not a “buy both because more is better” offer. It is a capital architecture: one reserve-core compounding engine and one capped asymmetry engine with written rules between them.

BTC remains the destination asset. XRP earns its seat by offering asymmetric cycle participation under a strict ladder and sleeve cap. The bundle is what prevents the amplifier from becoming the portfolio.

1. What each sleeve is for

Sleeve	Role	Evidence base	Economic purpose
BTC	Reserve core	Matched-control live scorekeeping and event-state evidence	Compound more BTC under calmer, benchmarked deployment.
XRP	Asymmetry sleeve	Event-family outcomes, same-window cycle models, robustness checks, and live plan-vs-auto scorekeeping	Capture rare high-value cycle windows without blind hold-through-cycle behavior.
Bundle	Capital map	Role separation, sleeve caps, reserve handling, transfer windows, and simplify rules	Turn asymmetry into reserve quality without losing control of the portfolio.

2. Public default capital map

A clean public default remains BTC-heavy: 70% to 85% BTC and 15% to 30% XRP, with 80% / 20% as the simplest starting point when no separate policy exists. XRP stays capped by design. Realized XRP trim cash stays in reserve by default and only moves on the written transfer window.

The bundle's job is not to maximize excitement. Its job is to convert selected asymmetry into a stronger long-run reserve asset under rules.

3. Who should buy both now

- Buy both when BTC is already your destination asset and XRP is meant to be a capped amplifier, not a competing identity.
- Buy both when you want explicit sleeve caps, reserve handling, and transfer windows written down before the stressful weeks arrive.
- Pass on the bundle when you only need the BTC reserve-core job or only need an XRP sleeve.

The cleanest one-line description is this: the bundle turns BTC and XRP into one rule-bound compounding architecture.
